IT 140 Final Project Script Three Draft Guidelines and Rubric
ATM Script

Overview: For your final project, you will be creating four small scripts. Collectively, the four scripts will demonstrate your ability to engage in the fundamental scripting and problem-solving approaches that are represented by the course outcomes.

Reminder: This is the first draft. Even if your script is not functioning perfectly, submit your draft and get feedback so that you can improve on it for the final submission in Module Seven.

Prompt: A function is a named series of statements. Invoking a function's name, known as a function call, causes the function's statements to execute. Python comes with a number of built-in functions, such as input(), int(), type(), and others. A programmer can also create a new function using the *def* keyword, the new function's name, and a block of statements. A block is a series of indented statements following the function definition.

To call a function, use the function's name followed by braces function_name(). This causes execution to jump to the function's statements. The function's return causes execution to jump back to where the original call occurred, to the next statement after the call. A good practice is to follow the convention of naming functions with lowercase letters and underscores, such as print_names or print_face.

Your task for this project is to create a simple ATM script. The script emphasizes the importance of using functions in the creation of more organized and reusable code.

You will be working in the Project Three: ATM Script module in Codio. Following the directions in that module, you will also determine the exact placement of the comments you will need to make in the code. Follow the directions in the module in Codio to walk through the activity. In the Codio activity you will work on having your script do the following three things:

1. Collect customer input
2. Calculate the ending balance
3. Display the results to the customer

After completing the activity, annotate the code. Specifically, your submission of the ATM script should address the following critical elements:

I. In Your Script (Annotated Text File)
Refer to the directions in the module in Codio for how to export out and comment your completed script.
   A. Identify examples of **custom functions** in your script using comments in your code.
   B. Identify examples of **input (parameters)** that are utilized within the **function(s)** in your script using comments in your code.
   C. Identify examples of **functions that return the correct output** in your script using comments in your code

Southern New Hampshire University

Rubric

Guidelines for Submission: This is a draft of part of the final project. Complete the steps in Codio, then export and comment on the completed script. Once completed, submit the document with your commented code to Brightspace. Feedback will be provided by your instructor to incorporate in the final submission and the reflection document.

Instructor Feedback: This activity uses an integrated rubric. Students can view instructor feedback in the Grade Center.

Critical Elements	Proficient (100%)	Needs Improvement (75%)	Not Evident (0%)	Value
Custom Functions	Identifies examples of custom functions in the script using comments in the code	Identifies examples of custom functions in the script using comments in the code, but examples are inappropriate or inaccurate, or comments lack key details	Does not identify examples of custom functions in the script using comments in the code	30
Input (Parameters) Function(s)	Identifies examples of input (parameters) that are utilized within the function(s) in the script using comments in the code	Identifies examples of input (parameters) that are utilized within the function(s) in the script using comments in the code, but examples are inappropriate or inaccurate, or comments lack key details	Does not identify examples of input (parameters) that are utilized within the function(s) in the script using comments in the code	30
Functions That Return Correct Output	Identifies examples of functions that return the correct output in the script using comments in the code	Identifies examples of functions that return the correct output in the script using comments in the code, but examples are inappropriate or inaccurate, or comments lack key details	Does not identify examples of functions that return the correct output in the script using comments in the code	30
Script Comments	Code comments explain and facilitate navigation of the code	Comments provide little assistance with understanding the code	Code is not fully annotated, or comments do not explain the code or do not facilitate navigation of your code	10
			Total	**100%**
